CAREER OBJECTIVE

To apply my extensive experience in software engineering to drive innovative, high-impact projects that solve real-world problems. I am eager to contribute to a dynamic and forward-thinking organization, while continuously evolving my skills, embracing new technologies, and fostering collaborative growth in a fast-paced, results-oriented environment.

TECHNICAL SKILLS

- Languages: Python, Ruby, NodeJs
- Cloud services: AWS, DevOps, Docker, CDK
- Framework : Rails, Selenium, Expressjs, Rspec, Nest Js, Serverless
- Linux Operating System
- WebTechnologies: HTML,CSS/SCSS
- Postgres, Mysql Database, Postgres
- IDE: Visual Studio, Sublime Text, Notepad++, Ruby mine.
- Version Control System : GIT
- Other tools : Postman
- Zapier

PROFESSIONAL EXPERIENCE

- Senior software Engineer at Bitcot Technologies Pvt. Ltd, Chennai From August 2022 to present.
- Software Engineer at Bitcot Technologies Pvt. Ltd, Chennai from August 2021 to August 2022.
- Software Engineer at Navaratan Technologies Software Pvt. Ltd, Hyderabad from December 2019 to August 2021.
- Highly motivated self-starter able to work independently and collaboratively with multiple teams in the organization
- Created complete test cases of varying complexity, executing tests, measuring expected and actual results, and reported status ensuring accurate coverage of requirements.
- Worked with the UI team to create a user interface team and presented to the business team for their approvals.
- I had experience of leading a team on ruby on rails and Node.
- Created automation workflows using zapier

PROFESSIONAL TECHNICAL SKILLS

- Working knowledge in HTML., slim
- Ruby on Rails.
- NodeJs, Express Js, Serverless
- Python with opencv
- Hands-on experience on Heroku.
- Created API's in Node.
- Created API's in ruby.
- AWS
- DevOps
- Docker
- Creates Web standards and guidelines using Rails.
- Skills of debugging and code optimization.
- Backend coding for Rails application.

- API Testing, Load Testing.
- TDD with Rspec framework
- Automations Using Zapier

PROJECT INVOLVED

SIYLI(search inside yourself): siyli is a platform that provides various types of online mediations that support multiple languages. This application is developed using ruby on rails(version 2.5.1)

Services Rendered:

- Made the application more user friendly by making some UI changes for sites(css/scss).
- Implemented different types of surveys for the different types of mediation programs.
- Implemented the Gsheet for all the surveys.
- Solved Heroku timeout issue which is taking a long time to run reports.
- Implemented google API.
- Implemented the rake task.
- Implemented the cron jobs.
- Implemented translation using crowdin in various languages.
- Bug Fixes.

AVHERO: Avhero is an application that acts as a platform between the service provider and the customer . It provides 4 types of services like audio, video, electrical, and others. This application is developed using ruby on rails (version 2.6.1)

Services Rendered:

- Implemented the Payment feature using stripe.
- Implemented the cc-bypass method which allows the admin to make the payment if the customer doesn't have a credit card.
- Implementing the Mailers.
- Worked on Enhancements and bug fixes

LocalOrbit: Local orbit is an online platform where an organization can buy/sell vegetables,Milk, etc.. products from the farmers Market. This application developed using ruby on rails (version 2.4.10)

Services Rendered:

- Implemented the categories and subcategories for the product.
- Implemented Deliveries page.
- Implemented the delivered scheduled times for markets.
- Implemented adding products to the next cycle when the delivery cycle ends.
- Worked on Enhancements and bug fixes.
- Worked on exporting the product data in csv format.
- Implemented the Newsheet.
- Implemented cart functionality with using sessions

MyVirtualFeet: My virtual feet is a platform where it provides the transporting of packages from one location to the other location. It has four roles: admin, company, driver, user. We receive the loads and notification will be sent to the drivers who are within the radius that was opted.

I have utilized Ruby 2.4.10 and the Unbound gem to enhance the application's functionality, enabling efficient handling of location-based notifications and seamless interaction between the platform's roles.

Additionally, I have implemented SendGrid's Inbound Parse Webhook to handle inbound emails. This integration allows the platform to receive and parse emails sent to designated addresses. When an email is received, SendGrid sends a POST request to our system with the parsed email content. This setup automates workflows, allowing for efficient email processing and notifications within the platform.

Services Rendered:

- Solved one of the major issue where server goes down twice in a week due to overuse of the application
- optimize the code in a way to load the data quickly.
- Implemented jobs to delete the data from the database once the request gets expired or satisfied after two month and its associated data
- Worked on Enhancements and bug fixes.
- Solving the major issue everyday at a particular point the cpu usage will be 100 percent by redirecting the redis local instance request to redis cluster.
- Implemented a new architecture on AWS EC2

EXIGIS: Exigis provides its customers a SaaS product which handles insurance compliance of its client's and their vendors all at a single place. Customers can use Exigis integration services to connect their systems or can leverage the Complianz portal to process Certificates of Insurance based on the rules customized to their needs in requirement sets.

I have utilized Ruby on Rails with Slim templates (Ruby version 2.7.1) to build and maintain robust, user-friendly applications. This experience has allowed me to effectively contribute to the development of seamless, scalable solutions for insurance compliance.

Services Rendered:

- Implementing the branching strategies
- Upgraded the heroku redis and heroku postgres
- Worked on TDD for every new feature that is added.
- Implemented workflow features for the agreements and parties of organizations
- Implemented message grouping functionality in a way to send a email if same workflow applies to the agreements in a party
- Upgraded the ElasticSearch Version and made the required changes.
- Worked on Enhancements and bug fixes.

- Implemented Efficient solutions to improve the performance of the application
- Implemented Cron setup on heroku and created jobs in different time zones according to the organization needs
- Worked on query optimization which are taking more time
- Implemented Announcement feature
- Implemented custom exception handler and exception notifications
- Implemented sentry to capture the errors and intimate the developers
- Helped in cost cutting on heroku
- Fixed bugs on circle ci environment
- Contributed in SysOps
- Worked on Audits and fixed issues after a change in rails 5 with the dirty active records

Ship Lab: ShipLab delivers beyond traditional 3PL services with intelligent logistics solutions that transform your supply chain into a competitive advantage. Its fulfillment center focused on providing simple and effective order fulfillment and inventory management to help entrepreneurs focus on growing their businesses. ShipLab has space for any and all brands, from simple project management to larger scale fulfillment, and innovative software to eliminate fees.

Using Zapier, we developed a private integration that allows for multiple reusable triggers. This solution enabled us to create a centralized database, along with custom Zaps and interfaces, to efficiently onboard and manage new partners, returns cancellations, shipments .

Services Rendered:

- **Automated Shipment, Cancellation, and Return Processes:**
 - Streamlined and automated the entire workflow for managing shipments, cancellations, and returns. This eliminated manual interventions, improved efficiency, and ensured faster resolution times for customers.
- **Zapier Integration with ShipHero:**
 - **Private Integration App Development:** Developed a private integration app that enabled multiple triggers within a single application, simplifying the process of automating workflows across different tools and platforms.
 - **Multi-App Integration:** Leveraged Zapier's capabilities to connect ShipHero with a variety of other applications, enabling smooth cross-platform workflows to automate e-commerce operations from order processing to inventory management.
- **Order Processing Automation:**
 - Set up custom workflows to automatically update order statuses, notify customers with real-time shipment tracking information, and trigger inventory updates upon order fulfillment, reducing manual tracking efforts and improving customer experience.
- **Inventory Management Automation:**
 - Ensured real-time inventory synchronization across platforms by automating updates in ShipHero whenever a product was sold on any connected platform, preventing stockouts or overstocking issues.
- **Customer Communication Automation:**

- Set up automated customer communication flows including order confirmations, shipment notifications, follow-up emails, and review requests based on key events like order fulfillment and shipment tracking.
- **Data Synchronization Across Platforms:**
 - Used Zapier to synchronize critical data such as customer information and order details between ShipHero and external CRM systems, ensuring consistent, up-to-date records across all platforms.
- **Custom Workflow Design:**
 - Designed tailored, custom workflows using Zapier to trigger actions based on specific conditions or events in ShipHero. This included integrating **Lambda Functions** for more complex and real-time processing needs.

TechCon SoCal: TechCon SoCal is an annual innovation and investment conference held in Southern California, bringing together one of the largest gatherings of industry leaders, investors, entrepreneurs, CXOs and technology enthusiasts. Dedicated to fostering collaboration and knowledge-sharing, TechCon SoCal provides an invaluable platform for professionals to learn from industry experts, exchange ideas, and explore new opportunities.

For their 2025 conference, we developed an Android and iOS application that allows users to connect with speakers and attendees, engage in conversations through the network, and view event listings and agendas. Users can add sessions to their personal agenda, receive push notifications, and schedule meetings and reminders. We built a serverless backend using Node.js, NestJS, and DynamoDB to support these features.

Services Rendered:

- Designed and implemented the database schema for various modules, ensuring scalability and optimal performance.
- Architected and deployed serverless solutions, optimizing resource utilization and reducing infrastructure costs.
- Overridden AWS Cognito authentication to enable login via Multi-Factor Authentication (MFA) and password, enhancing security and user experience.
- Developed and automated data import processes using Zapier, streamlining data integration from spreadsheets and reducing manual work.
- Managed data imports for access provisioning through the Events.com API, ensuring seamless synchronization and access control.
- Led the backend development for the Admin module, optimizing functionality for system administrators and improving management workflows.
- Implemented push notification systems leveraging AWS EventBridge for real-time schedule reminders, ensuring timely communication.
- Engineered the database architecture for Meeting and Meeting Request modules, ensuring smooth scheduling, tracking, and notifications for meetings.
- Automated announcements publishing using Zapier, setting up a workflow for hourly and minute-based notifications to enhance real-time communication.
- Led the resolution of enhancement requests and bug fixes, maintaining high system

reliability and user satisfaction.

- Conducted code quality audits and resolved SonarQube issues, ensuring adherence to best practices and maintaining clean, maintainable code.
- Led a cross-functional team in executing the development strategy, fostering collaboration and aligning efforts with business objectives.
- Mentored team members and provided guidance on technical best practices, code reviews, and troubleshooting.
- Coordinated sprint planning, daily stand-ups, and retrospectives, ensuring project milestones were met and fostering an agile development environment.

Permissionize: Permissionize's unique solution allows permission records to be stored and accessed through the blockchain. Permission Refresh is a powerful tool that allows growth-driven companies, like yours, to revive old leads and generate new revenue from otherwise dead assets. Backend is developed by node js.

Services Rendered:

- Created Vendor Portal Management.
- Handled complex queries and optimized it for better performance.
- Created Admin Portal Management.
- Created a Payment portal for admin and clients.
- For each functionality we have created test cases using jest framework
- Created Report management
- Created Report functionality for each module that's developed
- Created detailed analysis of client spends on the every permission that sold under the admin portal
- Created a document on how to connect to socket for every vendor and it has been stored on the server as it doesn't use any AWS services.
- Handled the entire team of 8 members FE and BE on revamping the entire application UI

Pegdesk: Peg Desk is a part of Pegasus and it's a platform which provides various types of cleaning services to different types of organizations and provides backend services using node js.

Services Rendered:

- Implemented Jobs in the Project that triggers emails periodically..
- Worked on code Optimization.
- I worked on creating the API.
- Implemented the Profilers in the project.
- Implemented the replica to reduce the load balance.
- Worked on Enhancements and bug fixes.
- Implemented schedules functionality which is similar to the zoom to send a reminder notification to the frontline worker about his assigned work every day, weekly and yearly.
- Moved few of the jobs to lambda services which requires more time to complete the executions
- Implemented preassigned urls to upload the images, pdf and videos to s3 bucket

MinMind: MinMind is an application that helps the employees of an organization or an individual person to improve their mental health by providing online meditation sessions and tracking their daily routines

and providing backend services using node js.

Services Rendered:

- Implemented Database Architecture for the application.
- I worked on Authentication.
- Implemented Middlewares on the project.
- Implemented the replica to reduce the load balance.
- Worked on Enhancements and bug fixes.
- Implemented preassigned urls to upload the images, pdf and videos to s3 bucket
- Worked S3 bulk uploads like videos, images, pdf's

JobLog: Joblog is an application that helps civil engineers to approve the E-plans and PDF and do digital signatures and verifications. Frontend is developed using php and backend is developed using nodejs. .

Services Rendered:

- Implemented multiple pdfs of a particular plan into a single pdf using pdf-lib and pdf-merger .
- Append the images on the merged pdf based on the co-ordinates that we get from the frontend.
- I worked on code optimization.
- Implemented preassigned urls to upload the images, pdf and videos to s3 bucket
- Implemented the image digital signature that was dragged and dropped from the UI and saved the pdf with the same coordinates that was sent by frontend by dividing the pages evenly based on the orientation of the pdf.

BAUER XCEL MEDIA: Bauer Xcel Media is the digital division of Bauer Media Group US, a women's lifestyle publisher. We can design Digital products, publish magazines, and make radio programs.

Services Rendered:

- UI changes for sites(css/scss)
- Implementation of subcategories in the Admin Module.
- Implementation of features in the Admin Module.
- Implementation of sail thru API.
- Implementation of postup API for Mailing.
- Email Automation for Bauer Xcel Media using Postup API in Admin Module (involved 17 sites)
- Implementation of VideoJs player.
- Implementation of Header bidding for videoJs.
- Implementation of third party Adquire Advertisement.
- Implementation of third party IronSource video Advertisement.
- Updated Ruby version 2.2.4 to 2.7.0 and rails to 4.2.4.1 to 6.0.2.1

UPC: UPC is a part of Bauer Media Group US, It publishes Magazine covers and Digital product covers.

Services Rendered:

- Updated the Ruby version from 1.9 to 2.6.
- Worked on entire code Refactorization.
- Worked on migrating database from Mysql to Postgres

EDUCATION

B.Tech in Computer Science and Engineering (Kamala Institute of Technology & Sciences)

62.8%(2018)

Board of Intermediate(SR. Junior College)

65.5%(2014)

Secondary School Certificate(St.Johns High School))

80.0% (2012)

PERSONAL PROFILE

Father's name : P.THIRUPATHI
Date of Birth : 28-06-1996
Gender : Male
Nationality : Indian
Religion : Hindu
Languages known : Telugu, English & Hind
