

Seeking a challenging engineering role where I can leverage my experience in leading cross-functional teams, delivering scalable software solutions, and driving continuous improvement across the development lifecycle. Working on new innovative design frameworks and making the overall Software Development process optimized and efficient.

SUMMARY:

- Extensive 10+ years of IT experience designing, developing, and delivering scalable enterprise applications across telecom, healthcare, logistics, and SaaS domains. Strong expertise in Ruby, Ruby on Rails, REST APIs, React JS, Angular JS, PostgreSQL, MySQL, MongoDB on the back-end and HTML5, CSS3, JavaScript, JQuery, AJAX and Bootstrap on the front-end.
- Experienced in AI-assisted software development using GitHub Copilot and Chatgpt tools to accelerate coding, testing, debugging, documentation, and productivity optimization.
- Skilled in designing and integrating RESTful APIs, third-party services, and real-time features using AJAX, JSON, and WebSockets.
- Successfully deployed and maintained cloud-native applications on Rancher, Marathon, AWS, Heroku, Docker, CI/CD, and Rackspace to ensure performance, reliability, and scalability.
- Integrated GitHub Copilot into daily development workflows for code generation, refactoring, debugging, improving development efficiency, reducing repetitive coding tasks and automated test creation.
- Experience in implementing Rails Migrations, Object Relational Mapping (ORM), Active Record, Action Pack and Action Mailer.
- Experience in Bitnami installation and setup with Ruby on Rails.
- Adept in authentication/authorization frameworks (Devise, OmniAuth, CanCanCan), background jobs (Sidekiq, DelayedJob), Ominiauth login(Keycloak SSO, Google, Github)and Agile methodologies.
- Proficient in backend and database technologies including Ruby, Python, PostgreSQL, MySQL, MongoDB, and Redis.
- Hands-on experience with DevOps tools such as Docker, Terraform, Ansible, and Jenkins, enabling automated CI/CD workflows and infrastructure as code.

- Participate in code reviews, troubleshooting, bug fixing and providing Production Support.
- Excellent communication skills and ability to work effectively in a team as well as individually in a fast-paced environment.
- Led and mentored cross-functional teams, managed project delivery, and collaborated closely with stakeholders to align technical implementation with business goals.
- Strong communicator and problem-solver, with a proven ability to optimize development processes, resolve production issues, and drive continuous improvement in dynamic environments.

TECHNICAL SKILLS:

- **Languages & Frameworks:** Ruby, Ruby on Rails, Bootstrap, React.js, Angular JS, HTML5, CSS3, jQuery, JavaScript
- **Database:** PostgreSQL, MySQL, MongoDB, Redis, SQLite3
- **AI & Developer Productivity Tools:** GitHub Copilot, ChatGPT, AI-Assisted Software Development, AI-Assisted Testing
- **Servers:** Nginx, Webrick, Puma, Unicorn
- **Testing:** RSpec, Rails Unit Test Cases, Capybara, Manual Testing
- **Cloud & Infrastructure:** AWS (EC2, S3), Heroku, Rackspace, Rancher, Marathon
- **DevOps & CI/CD:** Terraform, Ansible, Docker, Jenkins
- **Version Control:** Git, GitHub, Bitbucket
- **Build Tools:** Capistrano
- **Integrated IDE's:** RubyMine, Sublime text, VS Code
- **Defect Tracking Tools:** Papertrail, Loggly, Mesos

PROFESSIONAL EXPERIENCE:

Qvantel Software Solutions, Hyderabad, Telangana, India (Sep 2020 to Present)

Project-1: CDT-WUI (Credit Decision Tool for FrontEnd)

The Qvantel Credit Decision Tool (CDT) is a configurable credit scoring decision engine that enables automated, high-speed, high quality credit decisions and customer screenings for B2C and B2B sales channels. It connects to Customer, Order and Revenue Management and readily integrates with a variety of external credit scoring services. Highly versatile rule creation and rule set creation for automated credit decisions, including internal white-list and blacklists. Rule creation and

definition using CDT's domain-specific language. CDT uses text templates in communicating its decisions.

Business instructions: Shown to salesmen as part of CDT response

Customer instructions: Shown to web shop customers as part of CDT response

Technologies: Ruby 2.7.3, Rails 6.0.3, Angular JS, Mysql, Rancher, Jenkins, Capistrano, Docker, Kafka, Keycloak SSO

Key Responsibilities:

- Implemented Frontend asset bundling via Shakapacker (Webpack) - styling with Bootstrap
- Containerised with Docker and Docker Compose for local development
- Introduce CI/CD via Jenkins with Rubocop linting, Shakapacker compilation, and coverage enforcement (SimpleCov)
- Utilized AI tools to accelerate migration activities from Rails 4 to Rails 6, modernizing the stack and enabling long-term maintainability and performance improvements.
- Integrated Kafka (Racecar) for event-driven audit logging and Redis for session management
- Configured Keycloak OAuth2/OIDC authentication with role-based access control (RBAC) across 4 permission levels
- Introduce Consul service discovery in a microservices architecture with end-to-end encryption
- Worked REST API integration with private OpenAPI-spec-backed services via Faraday HTTP client
- Implemented RSpecs for all view pages using feature test cases.
- Supported multiple telecom operators (Djezzy, Beeline, Salt/VeonGE, Banglalink, Jazz, wind3) via environment-based theming (UI_THEME)
- Per-customer environments, deploy scripts, and i18n locale files
- Multi-environment Capistrano deployments: Production, Staging, UAT — per operator
- Automated infrastructure and CI/CD workflows using Jenkins and repeatable deployments using Artifactory versions.

Project-2: CDT-Backend (Api Based Backend Application)

Built a configurable, DSL-driven rule engine that dynamically evaluates credit decision rules against incoming requests. Rules are authored in a custom grammar (Citrus / OCL — Object Constraint Language) and parsed at runtime.

Technologies: Ruby 2.7.3, Rails 6.0.3, Rest API, Redis, MariaDB, Docker, Jenkins CI/CD , Capistrano

Key Responsibilities:

- Developed a configurable credit decision engine in Ruby on Rails processing residential and business credit requests using a custom OCL-based rule DSL, with versioned rule sets and full audit logging.

- Integrated with multiple external financial systems (CreditReform bureau, Order Management, Customer Management, CredVal scoring service) via REST and HTTPS/XML clients with configurable timeouts and error handling
- Designed a scoring engine applying weighted rule consequences to compute credit scores alongside binary accept/reject decisions
- Implemented automated blacklist management with daily import cron jobs and lookups across multiple source systems
- Built a real-time event system using WebSockets (Redis-backed) for live decision status updates
- Maintained a fully Dockerized development environment with Jenkins CI/CD pipeline and Capistrano-based multi-environment deployment
- Authored RSpec test suites with, FactoryGirl factories, DatabaseCleaner isolation, and SimpleCov coverage reporting
- Supported multiple telecom operators (Djezzy, Beeline, Salt/VeonGE, Banglalink, Jazz) via environment-based theming (UI_THEME)
- Per-customer environments, deploy scripts, and i18n locale files
- Multi-environment Capistrano deployments: Production, Staging, UAT — per operator

Project-3: RBS-UI

RBS UI is an enterprise-grade telecom billing management web application built with Ruby on Rails, serving as the front-end interface for Qvantel's RBS (Rating & Billing System) REST API. The application manages end-to-end billing operations including invoice generation, payment tracking, billing cycle management, subscription handling, debt collection workflows, and configurable fee models. The system follows a zero-database architecture where all data is fetched and validated in real time against an OpenAPI specification.

Technologies: Ruby 3.4.9, Rails 7.2.2, Hotwire (Turbo + Stimulus), Bootstrap 5, Chart JS, Rancher, Consul(Service Discovery), Keycloak SSO, Docker, SonarQube, Swagger

Key Responsibilities:

- Built a billing management portal managing invoices, payments, billing cycles, billing accounts, subscriptions, and fee models via REST API integration
- Implemented Keycloak SSO authentication with OmniAuth, supporting enterprise OAuth2 login flows discovered dynamically via Consul service registry
- Leveraged GitHub Copilot for AI-assisted code generation, refactoring, and automated test case creation, accelerating feature development and improving code quality.
- Applied prompt engineering techniques to generate reusable Ruby service objects, API integrations, and technical documentation, reducing development effort.
- Designed parallel API request loading using multithreaded background workers to reduce page load latency
- Developed paginated search interactions with dynamic RBS API query parameter mapping across 30+ resource types
- Maintained 100% test coverage with RSpec and Capybara test development using AI-powered coding assistants, contributing to high test coverage and faster release cycles.

- Containerized with Docker multi-stage builds and deployed via Jenkins CI/CD pipeline with SonarQube quality gates
- Support to VEON countries, WOM, Xterm, wind3

Project-4: PAULA (OSS Viewer)

Paula is a Rails 4.0.2 web application with no database (ActiveRecord is disabled). It's a subscriber lookup tool for telecom operators, integrating with an Ericsson **CAI3G SOAP API** via the Savon gem. Built an internal Subscriber Management Portal for telecom operators to look up and display real-time subscriber data by MSISDN. OSS Viewer allows easy access to complete OSS info on the network state of each subscription. It makes queries towards the network to get the full information.

Technologies: Ruby 2.0.0-p648, Rails 4.0.2, Capistrano, React JS

Key Responsibilities:

- Integrated with Ericsson CAI3G SOAP API using WSDL-driven client with using Savon gem
- Implemented session management with auto-retry on expired/invalid session tokens
- Consumed multiple SOAP services: SessionControl and Provisioning
- Parsed and displayed rich subscriber data across network elements: HLR, VLR, AUC,, MNP
- Modelled complex HLR data: PDP contexts, basic services, call forwardings (CFU/CFB/CFNRY/CFNRC) bearings operator barrings, CLIP/CLIR
- Supported multiple telecom operators (Djezzy, Beeline, Salt/VeonGE, Banglalink, Jazz) via environment-based theming (UI_THEME)
- Per-customer environments, deploy scripts, and i18n locale files
- Multi-environment Capistrano deployments: Production, Staging, UAT — per operator

Project-5: B2C-FLEX-ECARE

Built a B2C self-service telecom portal enabling customers to manage subscriptions, invoices, packages, payments, cases, and top-ups. Architected as a Rails Engine (no database) — all data sourced from external BSS APIs via JSON:API

Technologies: Ruby 3.4.9, Rails 7.2.2, React JS, Node JS, Foreman, Hotwire (Turbo + Stimulus), Bootstrap 5, , Webpack, rancher, consul (service discovery), Keycloak SSO, Redis, Jenkins

Key Responsibilities:

- No-database architecture — all state in external APIs (BSSAPI, Flex BPMN Executor, Document storage)
- Designed business logic using ActiveInteraction pattern (typed inputs, validations, composable service objects)
- Integrated Keycloak (OpenID Connect / OAuth2) for SSO authentication using OmniAuth
- Implemented concurrent API calls using Concurrent::Promise to reduce page load times

- Adopted GitHub Copilot for AI-assisted development, enabling rapid implementation of Rails service objects, API integrations, and frontend components.
- Consumed BSSAPI (Business Support System) for all customer, subscription, invoice, and payment data via jsonapi-orm
- Implemented a Relay Engine (flex) as a Rails Engine to proxy BPMN process requests from the frontend to the Flex BPMN Executor API
- Implemented System-specs to configure application artifactory path, versions, builds, Tags for consul lookup
- Configured service discovery via Consul for dynamic runtime configuration of external services
- Built secure file relay endpoints with per-user authorization checks before proxying to document storage
- Managed Content Security Policy (CSP) and Permissions Policy headers across environments
- Maintained 100% test coverage with RSpec, Capybara, WebMock, and Jest in a zero-database architecture
- Applied AI-assisted testing approaches to generate RSpec scenarios, validation cases, and regression test coverage.
- Containerized with Docker multi-stage builds and deployed via Jenkins CI/CD pipeline with SonarQube quality gates
- Wrote multi-stage Dockerfiles (Node builder + Ruby Alpine) for lean, production-ready container images
- Led the Rails 6 to Rails 7 migration, improving performance, long-term maintainability.
- support to telecom-namibia, Giga customers

Project-6: REVOLVER

Bill formatter generates PDF by processing the XML generated by RBS. It is also known as revolver internally. The Bill formatter runs in multiple dedicated servers. Both HTTP Revolver and MQ Revolver will be running in all the servers present in their respective environments. **HTTP Revolver** works based on receiving an API request and generates only one PDF. **MQ Revolver** works based on requests received through the message queue and generates more than one PDF.

Technologies: Ruby 2.3.8, Docker, RabbitMQ

Key Responsibilities:

- No-database architecture — all state in external APIs (Document storage)
- Implemented PDFs based on multiple Invoice layouts and xml formats
- Supported multiple telecom operators (Djezzy, Beeline, Salt/VeonGE, Banglalink, Jazz) via environment-based theming (UI_THEME)
- Store generated invoices into particular dedicated servers and Other customer portal can access this pdf's from document storage using BSS api request

OSI Digital, Hyderabad, Telangana, India. (Mar 2019 to Sep 2020)

Project-7: Cryoport (Upgrade from V1 to V2)

Cryoport is the leading provider of cold chain logistics solutions for temperature-sensitive life sciences materials, serving biopharmaceutical, IVF and surrogacy and animal health organizations around the world. Cryoport 2.0 is an enhanced version of Cryoport 1.0, which is mainly designed to increase the page to page navigation speed which in turn increases productivity and profits.

Technologies: Ruby 2.5, Rails 5.2, Mysql, AWS EC2, Capistrano, Nginx, Circle CI, Git, Docker

Key Responsibilities:

- Implemented RSpecs for all the models.
- Involved in Cryoport V1 to V2 database mappings.
- Worked on Foreign Key implementations for the V2 tables.
- Implemented database integrity changes for some of the tables.

Chetu Inc., Noida, Uttar Pradesh, India. (Jan 2016 – Mar 2019)

Project-8: BodiesDoneRight

Bodies Done Right is an online program, which provides the tools to maintain health for good. In this project participants will get virtual exercise training, education, accountability, and results. This application also supports HIPPA compliance. User profile contains educational videos and quizzes, wellness journal, success tracking tools, workouts tied to an activity monitor, nutritional logs and communication with a trainer, trainer tips, and recipes. This system allows you to get trained anywhere, at any time and without expensive equipment.

Technologies: Ruby on Rails, PostgreSQL, Bootstrap, AWS EC2, Capistrano, Nginx, Git

Key Responsibilities:

- Participated in the review and documentation of technical specifications.
- Implemented Bulk SMS, Bulk Email Functionality, activity logs for all users.
- Involved in Stripe Payment Gateway for payments and retrieving the data from Stripe API
- Implemented RESTful API for participants and trainers interface.
- Implemented User health report using Prawn gem.
- Implemented Participants or Trainers search functionality by using a meta-search gem.

Project-9: Galaxygaming-IG

Web application to maintain table Game in Casino. Admin maintains the games, jackpots, tables through this portal. This site is used locally in a single casino. Made Connection from this application with electronics devices (EN, DL, TV devices) that has configured IP through LAN cables.

Technologies: Ruby 1.8, Rails 3.2.5, Node js, apache, Bitnami, MySQL, Git

Key Responsibilities:

- Understanding Requirement Specifications and Design Documents.
- One core part of this site is to get messages from hardware devices through socket programming and by using event-machine to listen for certain ports for messages.
- Involved in generating reports based on audit logs.
- Modified the wager related code logic in the event file
- Involved in the manual testing of the application.
- Implemented Bash Scripts for installation of games into client environments.
- Bitnami software configuration into client environments.

Education:

Bachelor of Technology in Computer Science – **JNTUH** (65%)

Master of Technology in Software Engineering – **JNTUH** (74%)
